

TOTO®

EcoPower® HE Urinal Flush Valve

TEU1LN - Exposed Valve 0.5gpf
TEU2LN - Concealed Valve 0.5gpf

Planet-friendly, superior flushing performance is easy to achieve with the EcoPower High Efficiency Urinal Flushometer Valve. Engineered to require no electricity or routine battery replacement, the EcoPower Flushometer Valve saves energy and water while providing maximum performance in even the most demanding commercial spaces. Available as an exposed unit or choose the concealed option for a more sleek look.

Performance Dashboard

Features & functionality

0.5gpf EcoPower® High-Efficiency Urinal (HEU) electronic flushometer valve
Hydropower self-generating system
Automatic sensor activated
12 hour automatic flush for trap seal protection
Piston valve technology
Manual override button
ADA compliant

TEU1LN & TEU2LN

Scope

☒ Cradle to grave

☐ Cradle to gate with options

☐ Cradle to gate

Functional unit
One average flush valve for urinals in an average U.S. commercial environment for 10 years. The period of 10 years is modeled as the period of application based on the average technical lifespan for commercial applications. The economical lifespan of commercial applications can be longer or lower due to aesthetic replacements or more intense use. The implication is that the LCA model assumes that the application ends at year 10 and that the materials will be treated in an end-of-life scenario.

Reference service life
The RSL is 10 years.

Default use phase scenario
10 years of service in an average U.S. commercial environment in combination with a urinal with 0.5 gallon/use, 18 uses/day, and 260 days/year resulting in 23,400 gallons of water.

Material composition greater than 1% by weight		
PART	MATERIAL	AVG. % WT.
Valve body	Bronze (C836000)	25.4%
Bottom cover	Zinc die cast	15.8%
Packaging	Cardboard	15.2%
Top cover	Zinc die cast	14.0%
Valve cap	Bronze (C836000)	7.9%
Valve tailpiece	Bronze (C836000)	3.5%
Manuals	Paper	3.1%
Tailpiece nut	Brass	1.3%
Solenoid coil	Copper	1.1%
	Other	12.7%

What's causing the greatest impacts

All lifecycle stages
The production stage dominates the results for all impact categories.
The production and use stages have significant contributions to all impact categories. The production has the most significant contributions to eutrophication (mostly from emissions from copper mining), non-carcinogens (emissions from the production of copper and zinc) and ecotoxicity (mostly from emissions during mining of copper, gold and zinc). The use stage is less dominant but it is still significant in most of the impact categories. The impact of the use stage is mostly due to the embedded energy arising from acquisition, treatment and distribution of the water used during the use of the product (i.e. a toilet or a urinal) to which the valves are installed.

The recovery stage includes recycling processes and benefits by preventing the need to produce primary materials. Recycling is a relevant factor for some of the impact categories, offsetting a portion of the impacts caused by production. Additionally, the delivery of the product to the construction/installation site, the construction/installation processes, the processes for dismantling the product and final waste treatment during the end of life stage do not have a significant impact.

Production stage
Bronze and zinc parts, together with the printed wiring board, have significant contributions to the impact categories. The stainless steel material is relevant to the carcinogenics category. The electroplating process is a major contributor to the ozone depletion category while the die casting process is relevant to the ecotoxicity and non-carcinogenics categories. Additionally, polishing and potting have somewhat significant processing contribution to the results. Transport via oceanic freighter appears as a relevant contributor to the fossil fuel depletion and smog categories. The remaining parts and processes contribute between 3% and 15% to the overall impacts in the rest of the categories.

Sensitivity analysis
The TEU1LN and TEU2LN versions are equal in the use phase; therefore, variations in the life cycle are driven by materials and processes that are used in one version of the product but not in the other. Examples are electroplating and zinc die casting, which are only used in the TEU1LN version. The TEU2LN version does not use zinc, and therefore no zinc die casting and electroplating of the zinc alloy are required.

Multi-product weighted average
Results represent the weighted average using production volumes for the products covered. Variations of specific products for diereces of 10-20% against the average are indicated in **purple** ; diereces greater than 20% are indicated in **red**. A dierence greater than 10% is considered significant.

TOTO PeoplePlanetWater. programs improving environmental performance

- TOTO's EcoPower® products are powered by the force of running water.
- The electronic and mechanical components are programmed and designed to allow water flow and accurate flush volume only when needed.
- Water consumption is reduced in the use phase due to superior flushing performance.

Part A: LCA Calculation Rules and Background Report Requirements | Version 2015 (Based on EN15804+A1; in compliance with ISO 14040-44, 14025)
Part B: Product Group Definition – Commercial Flush Valves

SM Transparency Reports enable purchasers and users to compare the environmental performance of products on a life cycle basis. They are designed to present information transparently to make the limitations of comparability more understandable. SM Transparency Reports of products that comply with the same Product Group Definition (PGD) and include the same life cycle stages, but are made by different manufacturers, may not sufficiently align to support direct comparisons. They therefore, cannot be used as comparative assertions unless the conditions defined in ISO 14025 Section 6.7.2, 'Requirements for Comparability' are satisfied.

Rating systems

The intent is to reward project teams for selecting products from manufacturers who have verified improved lifecycle environmental performance.

CONSTRUCTION

TOTO participates in the UPS Carbon Neutral program. TOTO is a certified SmartWay partner.

USE

TOTO's EcoPower® Urinal Flush Valves feature the highly regarded EcoPower technology. Engineered to reduce environmental impacts, TOTO's EcoPower products offer water and energy savings without sacrificing performance. Below are some of the features of TOTO's EcoPower technology.

SENSOR:
Ensuring that water flows only when needed, the self-adjusting EcoPower sensor eliminates “ghost” flushing that wastes water. A minimum of six seconds presence in front of the sensor is required to get its acknowledgement, and a three second flush delay after stepping away from the sensing zone prevents excessive flushing.

MICROTURBINE:
TOTO's EcoPower technology enables the product to operate 100% off grid. As water flows, the microturbine recharges the capacitor for the sensor and solenoid. Less reliance on the back-up battery results in much less battery waste. With as little as 30 uses a day, the back-up battery can last up to 10 years.

COURTESY FLUSH:
A 12-hr courtesy flush maintains trap seal during periods of low use, preventing the need for unnecessary cleaning.

SOLENOID AND PISTON:
The piston and solenoid mechanism, a marked improvement over traditional rubber diaphragm type valves, maintains consistent flush volume under a range of supply pressures.

Using our proven EcoPower engineering, the 0.5 gallon per flush urinal flush valve reinforces TOTO's performance reputation while offering an additional water savings.

Metal and electronic parts can be recycled at the end of life.
